

# Zomato Restaurant Analysis

|                                         |                                              |                                     |                                               |
|-----------------------------------------|----------------------------------------------|-------------------------------------|-----------------------------------------------|
| 36,402                                  | 8,910                                        | 0.42                                | 0.89                                          |
| unique restaurants (of 56,252 raw rows) | cost/rating points used for pricing analysis | correlation: table booking & rating | R <sup>2</sup> of the rating prediction model |

## Key Findings

- **Volume vs. rating differ.** North Indian & Chinese lead on listings; niche cuisines (Continental, Italian, Asian) rate highest (~3.9–4.0★).
- **Geographic clusters.** BTM, Koramangala 5th Block & Indiranagar top both restaurant density and customer engagement.
- **Price tracks rating.** Median rating rises from Budget to Fine Dining, with variance narrowing at higher price tiers.
- **Booking beats ordering.** Table-booking availability correlates with rating (r=0.42) and cost (r=0.62); online ordering barely correlates with rating (r=0.06).
- **Ratings are predictable.** Random Forest on listing metadata explains 89% of rating variance (R<sup>2</sup>=0.89, RMSE=0.15).

## Top 5 Recommendations

- **1. Hub partnerships** — focus onboarding on BTM, Koramangala, Indiranagar.
- **2. Curated collections** — theme pages from cuisine/dish word-cloud data (Biryani, Desserts).
- **3. Tiered commissions** — lower fees for Economy volume, premium placement for top Fine Dining.
- **4. Table booking & pre-order** — booking tracks with higher ratings and larger baskets.
- **5. Niche cuisine expansion** — cloud kitchens for Continental/Asian fusion in under-served areas.
